The Information Systems Education Journal (ISEDJ) is a double-blind peer-reviewed academic journal published by EDSIG, the Education Special Interest Group of AITP, the Association of Information Technology Professionals (Chicago, Illinois). Publishing frequency is quarterly. The first year of publication is 2003.

ISEDJ is published online (http://isedj.org) in connection with ISECON, the Information Systems Education Conference, which is also double-blind peer reviewed. Our sister publication, the Proceedings of ISECON (http://isecon.org) features all papers, panels, workshops, and presentations from the conference.

The journal acceptance review process involves a minimum of three double-blind peer reviews, where both the reviewer is not aware of the identities of the authors and the authors are not aware of the identities of the reviewers. The initial reviews happen before the conference. At that point papers are divided into award papers (top 15%), other journal papers (top 30%), unsettled papers, and non-journal papers. The unsettled papers are subjected to a second round of blind peer review to establish whether they will be accepted to the journal or not. Those papers that are deemed of sufficient quality are accepted for publication in the ISEDJ journal. Currently the target acceptance rate for the journal is about 45%.

Information Systems Education Journal is pleased to be listed in the 1st Edition of Cabell’s Directory of Publishing Opportunities in Educational Technology and Library Science, in both the electronic and printed editions. Questions should be addressed to the editor at editor@isedj.org or the publisher at publisher@isedj.org.

ABSTRACT

This study examines whether students’ final grades in an introductory college business computing class correlate with their self-reported computer skill levels provided at the beginning of the course. While significant research effort has been devoted to studying the effects of student self-efficacy on course outcomes and studying the moderating effects of various demographic variables (such as age and gender) and experience variables (such as computer access at home), there is a dearth of studies examining a student’s grade-point-average (GPA) as a predictor of final course success in the introductory computing class. For the fundamentals of computer applications course at the medium-size state college, student self-perceptions of their own computer abilities explained very little of the variation in the final course grade outcomes. GPA, however, was a more powerful predictor (adjusted $R^2 = 0.365$) of the final class grade as well as the students’ grades on individual course modules. Students’ perceptions of their own computer abilities added very little additional predictive value, increasing the full model’s adjusted $R^2$ only to 0.393. Given the predictive power of GPA relative to course success, discussion is included concerning ways to use this information to offer additional assistance to lower performing students. The study contributes to the existing literature and refutes the value of self-assessment of skills and abilities as a sole predictor of success. Although the literature has suggested non-traditional or adult students may have more difficulty with the computer course, our findings do not support this. Areas for future research are suggested.

Keywords: information literacy, business student, introduction to computers, self-efficacy, computer literacy
1. INTRODUCTION

Information literacy research is growing due to the Internet, digital media, and the pervasiveness of personal computers. With electronic media and devices proliferating, what encompasses computer literacy and fluency becomes a changing construct and universal definitions still do not exist. McDonald (2004) agrees the definition of computer literacy continues to change as technological innovations are adopted by the marketplace. There is broad agreement, however, that college students need computer and information literacy as part of their studies to be competitive as graduates in an environment that increasingly relies on information technology.

The challenge for universities is to ensure their students meet a minimum level of competency when using constantly changing technology. McDonald (2004) further suggests universities incorporate flexible testing tools to measure basic computer skills such as an Internet-based, interactive skills test. Hawkins and Oblinger (2006) indicate technology is nearly ubiquitous on campus; and, although conversations about the digital divide are relatively uncommon today, it remains incorrect to assume all students own a computer or have an Internet connection.

2. LITERATURE REVIEW

Colleges have traditionally used the freshman- or sophomore-level course in microcomputer applications/introduction to computers to accomplish basic computer literacy. The purpose of this research is to determine if predictors exist for student success in this course. Most studies focusing on students’ skill and success in the introduction to computers course at the college level examine a variety of experience variables, demographic variables, and students’ self-reported skill levels on a variety of microcomputer applications. This latter variable is termed self-efficacy.

Self-Efficacy

Self-efficacy is a social cognitive construct popularized in the 1970s and later formally defined by Bandura (1986) as “people’s judgments of their capabilities to organize and execute courses of action required to attain designated types of performances” (p. 39). Bandura (1986) argued beliefs about efficacy influence a person’s choice of activities, the level of effort an individual is willing to expend, their persistence even in the presence of difficulties, and their overall performance. Self-efficacy remains a key concept in social cognitive theory.

Computer Self-Efficacy

Computer self-efficacy is a derivation of self-efficacy in general (Bandura, 1986, 1997) and has been defined as "...a judgment of one’s ability to use a computer” (Compeau & Higgins, 1995, p. 192). It has also been studied and found to be a determinant of computer-related ability and the use of computers (Hasan, 2003). Hasan and Jafar (2004) empirically examined computer-learning performance and used the definition of self-efficacy as referring to an individual’s judgment of their own capabilities to organize and execute courses of action to attain designated performance.

Compeau, Higgins, and Huff (1999) found that those individuals with a higher computer self-efficacy participate in computer-related activities, expect success in these activities, persist and employ effective coping behaviors when encountering difficulty, and exhibit higher levels of performance than individuals low in computer self-efficacy. Karsten and Roth (1998a) found that the construct captures the competence and confidence management information systems (MIS) professors hope to provide their students. The construct has been studied in depth by a number of MIS researchers (see Agarwal, Sambamurthy, & Stair, 2000; Marakas, Johnson, & Clay, 2007; Marakas, Yi, & Johnson, 1998).

Students gain self-efficacy from a variety of sources (Bandura, 1997), including their personal successes and failures, observing the successes and failures of friends and classmates, encouragement, and confidence or anxiety when faced with tasks. Computer self-efficacy is dynamic, changing as students gain new information and computer-related experiences (Gist & Mitchell, 1992), but Karsten and Roth (1998b) found that it is the kind of experience, and not just the experience per se, that changes perceptions of computer self-efficacy. Marakas, Yi, and Johnson (1998) studied the construct and separated task-specific measures of computer self-efficacy from general computer self-efficacy. They defined the task-specific measures as "...an individual’s perception of efficacy in performing specific computer-related tasks within the domain of general computing" (Marakas, Yi, & Johnson, 1998, p. 128).

Hasan (2006a) further described the construct as a judgment of efficacy (or success or skill) in...
performing a well-defined computing task using a particular application, including word processing, spreadsheet, or database programs. Qutami and Abu-Jaber (1997) studied gender and cognitive learning styles to determine students’ self-efficacy in computer skills. Shiue (2003) studied the effect of cognitive learning styles and prior computer experience on students’ computer self-efficacy in computer literacy courses, while Albion (2001) used pre- and post-tests and found that students’ self-efficacy, after completing computing courses, was influenced by their personal ownership of computers. Hsu and Huang (2006) found that computer use and interest had a significant, direct effect on student computer self-efficacy. They further found that computers at home and work had indirect effects on computer self-efficacy as did trend motivations and interests. Computers are pervasive in business and education, and Buche, Davis, and Vician (2007) agree it would be easy to assume that all individuals embrace technology. However, their study found that 30 to 40 percent of individuals experience some level of computer anxiety.

Self-Efficacy, Computer Literacy, and Demographics

Studies of the first computer course have explored gender differences in self-efficacy and attitudes toward computers (Busch, 1995). Busch (1996) added group composition and cooperation variables to his subsequent study. Introductory information systems course-related factors were also studied as indicators of computer self-efficacy (Karsten & Roth, 1998a), while Houle (1996) studied student differences (including a variety of demographics characteristics) in his research on understanding student differences in computer skills courses.

Davis and Davis (2007) surveyed 58 students in technology teacher education and training to determine self-perception of their competency in five constructs made up of 43 elements related to personal computer knowledge and skills. While gender did not make a difference, they did find a statistically significant difference between the perceived competencies of the participants based on age range, with students 35 years old or younger perceiving a higher level of competence compared to those 36 years old or older. Further analysis within construct variables revealed instances of statistically significant differences based on gender and age range.

Divaris, Polychronopoulou, and Mattheos (2007) agree an accurate assessment of the computer skills of students is a pre-requisite for success in other areas, including e-learning. They studied 50 post-graduate students and calculated competence scores and gathered socio-demographic characteristics. Using both descriptive statistics and linear regression modeling, the authors found that competence scores were normally distributed but that gender and use of e-mail were significant predictors of computer literacy.

Students believe they are computer literate according to Wilkinson (2006). Her research compared students’ perceptions with reality and found that students did not perform well on pre-tests of Microsoft Office™, but improved their post-test scores with instruction. She found that a comparison of student classifications regarding perceptions with the reality of computer productivity yielded no significant differences but did find significant differences between Caucasian students and ethnic minorities.

Goh, Ogan, Ahuja, Herring, and Robinson (2007) investigated the relationship among computer self-efficacy, mentoring, and the gender of students and their mentors. Students with male mentors reported significantly higher computer self-efficacy as compared to those students with female mentors. Kuhlemeier and Hemker (2007) studied the impact of secondary students’ use of the Internet and the computer at home on the digital skills they need in school and found that home access to e-mail and students’ use of home computers for various tasks, including surfing, e-mailing, chatting, and text processing were related to Internet and computer interest. Ballantine, Larres, and Oyelere (2007) studied the reliability of self-assessment as a measure of computer competence. They agreed recent research on the topic has employed self-reported ratings as the sole indicator of students’ computer competence. They compared the self-assessment to results on objective tests and found that students significantly over-estimated their level of computer competence. Interestingly, they found that students’ home and high school computer use did not affect the results, and they questioned the use of self-assessment as a measure of computer competence.

In their study of the digital divide, Tien and Fu (2008) used multiple regression and logit models and found that demographic and socioeconomic family background did not predict computer skills of first year college students. They did find that different kinds of computer
knowledge affect student learning with knowledge of software helping students learn the most. Some differences in computer knowledge were found among female students, minorities, and those with blue-collar or unemployed parents. These students were at a disadvantage in digital understanding. Banister and Vannatta (2006) suggest colleges must develop strategies to assess technology competencies of beginning college students and then move beyond such assessments to provide student support for achieving technological competencies. They found that various methodologies have been used to measure a student’s computer competencies but agree that there are no standardized scales for assessing competence.

In her study of the introduction to computers course, Webster (2004) examined the relationship between computer use confidence and computer literacy scores before the course began and repeated the test at the end of the course to assess gains in computer usage confidence and literacy. She found that prior computer classes and computer usage positively influenced literacy scores and confidence. In addition, she found that hours using the computer for e-mail purposes also influenced confidence scores. After completing the introductory course, students had higher confidence and literacy ratings than the control group.

In their study of the reported experience, comfort level, and perceived information technology skills of 233 college students, Messineo and DeOllos (2005) found that students view their computer competence differently depending on whether they are using the technology for personal or course-related tasks. They discovered that even when the expressed levels of experience and comfort for some forms of technology were high, exposure to and confidence with more advanced applications were lacking. They agreed faculty members may make false assumptions about student preparedness, which hinders their students’ success. Their research found differences by gender and race/ethnicity and suggested faculty should be aware of the varied skill levels and experiences of their students.

Cassidy and Eachus (2002) developed a computer user self-efficacy scale. They agree self-efficacy beliefs have been identified as a success factor for completing tasks. With the increasing reliance on computer technologies in all aspects of life, it is important to measure the construct. Their research found a significant positive correlation between computer self-efficacy and computer experience. Familiarity with computer software packages was a significant predictor of computer self-efficacy, and computer ownership and training increased efficacy. In their study, males reported higher results than females. This supports the findings of Varank (2007) who found that gender was significant for predicting computer attitudes but not perceived skills. In Mayall’s (2008) study of technology self-efficacy among high school students, no statistically significant differences based on gender were detected in either pre- or post-tests.

Stephens (2006) found that subjects with low computer self-efficacy will avoid interacting with computer technology when given a choice or opportunity. Oblinger and Hawkins (2006) suggest that when faculty, staff and administrators see how easily students use technology, they may mistakenly assume students have more than adequate IT competency. They question whether students are competent or just overly confident and caution having no fear is not the same as having knowledge or skill. Stephens (2005) developed a decision support system built around a self-efficacy scale that can be implemented to perform training needs assessment. The system can determine who requires training and which training mode is most appropriate.

**Computer Course and Instruction**

In their research, Creighton, Kilcoyne, Tarver, and Wright (2006) ask two related questions: Is a freshman-level microcomputer applications/introduction to technology course obsolete? Are students, especially new freshmen, enrolling in the course already computer literate? Their research found that students enrolling in such courses were not literate in general computer technology and spreadsheet applications, but were computer literate in the more familiar and often used word processing, e-mail, and Internet applications. They found the higher the ACT score, the better the students scored on the objective pre-test exam and the performance-based post-test exam, but found only a weak relationship between taking a previous computer course and pre-test scores.

Hollister and Koppell (2008) studied the information technology course in an assurance of learning program in an undergraduate
program at an AACSB accredited business school to redesign the content and pedagogy of the computer literacy course. Mykytyn (2007) agrees that while colleges of business have dealt with teaching computer literacy and computer application concepts for many years, teaching tool-related features in a lecture in a computer lab may not be the best instructional mode. He suggests problem-based learning as an alternative for teaching computer application concepts, operationally defined as Microsoft Excel™ and Access™. Ballou and Huguenard (2008) studied an introduction to computer course with both a lab and lecture component and found that higher levels of perceived computer experience positively affected lecture and lab homework and exam scores.

Hindi, Miller, and Wenger (2002) investigated students’ perceptions of computer literacy skills they had obtained prior to enrolling in a university to develop implications and recommendations for teaching a college-level computer course. Students perceived themselves better prepared in word processing than they were in spreadsheet and database applications. However, computer self-efficacy measures suffered from degradation of their explanatory power over time (Marakas, Johnson, & Clay, 2007).

The proposed research model developed by Hasan (2006b) makes a clear distinction between general and application-specific computer self-efficacy and found that both had negative effects on computer anxiety. A model by Thatcher and Perrewe (2002) found that computer anxiety mediates the influence of situation-specific traits on computer self-efficacy.

Karsten and Schmidt (2008) in their ten-year study of business student computer self-efficacy found that when controlling for changes over time, students have lower computer-self efficacy in 2006 than in 1996. It was surprising that increased use of computers and technology over time did not lead to higher self-efficacy scores. Sharkey (2006), in her study of information fluency and computer literacy, found that universities are responding with a more rapid integration and adoption of technology and emphasizing information use and retrieval. Findings on self-efficacy and computer skills acquisition among graying workers by Reed, Doty, and May (2005) suggested older participants’ beliefs about their efficacies in acquiring computer skills were lower than their actual abilities.

GPA

Research has considered a number of demographic variables as determinants of student performance in various business courses. Trine and Schellenger (1999) studied determinants of student performance in an upper level corporate finance course and found that GPA, the financial accounting grade, basic finance grade, math ACT, a self-motivation factor, an information processing factor, and sharing living quarters with non-family members were all significant in determining the student’s course performance. Typically the list of variables is more limited to gender, age, or ethnicity.

Wilson, Ward, and Ward (1997) found that both self-reported and actual data on ACT scores, GPAs, and grades earned in specific courses were similarly correlated with accounting course performance. Christensen, Fogarty, and Wallace (2002) studied the directional accuracy of self-efficacy and performance in accounting courses mid-way through the academic term. They found the more conservative a student’s self-efficacy of their skill levels and abilities, the higher the second exam score and final course grade, even when controlling for cumulative GPA in accounting courses, average exam performance, number of accounting classes completed, and the extent of involvement in extracurricular activities. There is a dearth of studies focusing on these demographic characteristics, specifically GPA, in the introduction to computers course.

Table 1 (Appendix A) summarizes variables affecting computer self-efficacy and/or performance for selected research.

3. METHODOLOGY

The literature on students’ self-efficacy in general and computer self-efficacy in particular considers a number of demographic characteristics and skill levels. However, inconsistencies remain as to which variables have the most predictive power. Our study extends the research on this topic and gathers data on student’s self-efficacy in a number of specific computer applications. The research examines if the self-rated skill sets are predictive directly or indirectly of the knowledge-level scores of the various computer applications or of the final, overall course grade and whether
such predictions are significantly improved by the inclusion of demographic and prior experience variables. The model shown in Figure 1 (Appendix B) indicates our hypothesized relationships and leads to our hypotheses.

H1: Student self-assessment of skills and abilities with Windows XP™ and selected Microsoft Office™ applications (Word™, Excel™, PowerPoint™, and Access™) and related skills and abilities is not a predictor of final course outcomes (final overall letter grade).

H2: Student demographic and experience data from the survey and the college Banner™ database system (including gender, age, high school computer training experience, prior college computer training experience, bachelor or non-bachelor degree candidate, previous attempts of the computer literacy course and overall/current GPA) are not predictors of final course outcomes (final overall letter grade).

H3: Student self-assessment of skills and abilities with Windows XP™ and selected Microsoft Office™ applications (Word™, Excel™, PowerPoint™, and Access™) and available student demographic and experience data from the survey and the college Banner™ database system are not predictors of final course outcomes (final overall letter grade).

The course chosen for study was an introduction to computer applications course. Appendix C includes an abbreviated course syllabus highlighting topic coverage and weights. The course covers multiple modules, including hardware and operating systems, productivity applications such as word processing, database and spreadsheet software, information literacy, networking, and the Internet. A survey instrument was developed based on key topics and constructs from the literature review. The survey was reviewed and further edited by management information system faculty for completeness and accuracy.

Survey Instrument

Students reported their name, e-mail address, and various phone numbers, as well as computer courses (identified by name) they had completed in high school, college, and/or technical school. They also completed a list of other computer training and experiences. On a five-point Likert-type scale, they rated their level of knowledge on various applications from 1 (none) to 5 (expert), with points in between for novice, intermediate, and advanced. No specific definitions of these terms were given. Applications included Windows XP™, MS Word™, MS Excel™, MS Access™, and MS PowerPoint™, as well as e-mail, Internet searching, and general computer hardware/software concepts.

The next questions focused on student’s personal goals as an outcome of the class and included their expected grade and a place for open-ended comments on what they hoped to achieve and the knowledge they expected to gain. The final three pages asked students to check their specific skills for each of the applications, including the computer operating systems, word processing, spreadsheets, databases and presentation software (See Appendix D for a copy of the survey instrument). Specific skill variables for each application were developed from the textbook used in the course.

Survey Population and Sample Demographics

Self-reported data were collected from 259 students in a freshman/sophomore-level microcomputer applications and introduction to information technology course at a medium-size, AACSB-accredited state college. The course is required for all business majors and is an elective for a number of associate and bachelor’s degree programs. Due to incomplete and missing data, 207 student surveys and records were used for the analysis.

Additional gathered information, as shown in Table 2 (Appendix A), included status as bachelor’s or non-bachelor’s degree student, overall GPA, gender, age (as date of birth), and overall course grade (all of which were gathered from the campus Banner™ database system following course completion). The age was separated to account for traditional versus nontraditional students using the breakdown used by Justice (2001) in her study of traditional and nontraditional-age college students. Justice (2001) defined traditional-age students as between 18 and 23 years of age and nontraditional-age college students as age 24 and above (through age 64). These are the age ranges used in this analysis. Individual student’s scores on each individual computer package (word processing, spreadsheet, database, and operating system) were obtained from the professor of record’s lab and lecture grades.
Research Design

Analysis was conducted by regressing students’ course grades (GRADERCD) on their self-rated level of knowledge of Windows XP™ (WINXP), MS Word™ (WORD), MS Excel™ (EXCEL), MS Access™ (ACCESS), MS PowerPoint™ (PPT), email (EMAIL), Internet search (INTSRCH), and hardware and software concepts (HWSW); on demographic variables gender (GNDR) and age (AGE); and experience variables representing students’ prior computer training in high school (HS_NONE) or college (COLL_NONE), bachelor’s and non-bachelor’s degree students (DEGRRCD), previous course attempt (PREVATT), and overall/current GPA. All independent variables except DEGRRCD were included because of their importance as a skill needed by students or their mention in the literature. Standard stepwise linear regression was used with criteria of probability of F to enter set at ≤ .05 and to exit ≥ .100. Three variables were found to be significant; see Table 3 in Appendix A. The resulting model is summarized in Tables 3, 4, and 5 (Appendix A).

4. FINDINGS

Since student self-assessments of Hardware/Software Concepts and MS Word™ knowledge and skills are significant in the model, the first hypothesis is rejected; student self-assessment of skills and abilities with Windows XP™ and Microsoft Office™ applications (Word™, Excel™, PowerPoint™, and Access™) and related skills and abilities is a predictor of final course outcomes.

Since GPA is significant in the model, the second hypothesis is rejected; student demographic and experience data from the survey and the college Banner™ database system (including gender, age, high school computer training experience, prior college computer training experience, bachelor or non-bachelor degree candidate, previous attempts of the computer literacy course and overall/current GPA) are predictors of final course outcomes.

Since two self-assessment items (Hardware/Software Concepts and MS Word™) and one demographic item (GPA) are significant in the model, the third hypothesis is also rejected; student self-assessment of skills and abilities with Windows XP™ and selected Microsoft Office™ and related applications and available student demographic and experience data from the survey and the college Banner™ database system are predictors of final course outcomes. The more interesting finding, however, is the small additional explanatory power associated with including Hardware/Software Concepts (adjusted \( R^2 \) increase = 0.016) and MS Word™ (adjusted \( R^2 \) increase = 0.012) compared with GPA (adjusted \( R^2 \) increase = 0.365).

The relative explanatory power of GPA and other factors is indicated in Table 6 (Appendix A). The increase in \( R^2 \) for course grade and individual computer package lecture and lab grades for GPA is greater than the combined \( R^2 \) increase for all other significant variables in all cases but one. In the one exception, Windows XP™ Lecture, GPA provides the single greatest increase in \( R^2 \) and enters the model first.

Comparing GPA and grade using the longitudinal data for this course, we find students with a 0.0 to 1.6 GPA are predicted to make an F in the course and a 1.7 to 2.1 GPA are predicted to make a D. Students with a 2.2 GPA or higher are predicted to pass the introduction to computers course with a grade C or better. GPAs of 2.8 to 3.2 are predicted to earn a course grade of B, while students with a 3.3 GPA or higher would be predicted to earn an A in the overall course.

Given the overwhelming importance of GPA in explaining course outcomes, it is probable student anxiety or “technophobia” regarding skills-based introduction to computer classes should not be an issue for good students (defined as having a high overall grade-point average). This result should be encouraging for the growing cadre of “non-traditional” or adult students returning to college, particularly in the current economic downturn. These students, who did not grow up with computers as did the traditional Millennial Generation college students of today, may feel at a disadvantage in the course or some level of stress upon entering the course. Faculty can reassure students about the similarity of the learning process in the computer course to other courses and stress that study skills and other study preparation resources are more important to course success than prior skills or perceived computer expertise.

5. DISCUSSION & AREAS FOR FUTURE RESEARCH

When assisting students with lower overall grade point averages, professors of the introduction to computers course should focus not only on course-specific skills, but on overall resources.
appropriate to improve students’ study habits. It may be that students having problems in the course are juggling work, family, and school demands or taking too many courses. Short sessions on managing time, improving concentration, preparing to study, reading textbooks, setting goals, managing test anxiety, and improving study habits may be more important for these students. Short workshops emphasizing these skills are often offered on college campuses. Advising students with low GPAs to take one or more of these targeted workshops prior to enrolling in the introduction to computers class may be warranted.

While our study was exploratory in nature, further studies should better pinpoint the GPA range that indicates whether students will have difficulty in the course. If future analysis confirms GPA as a key predictor, then faculty may want to advise students with these lower GPAs to enroll in workshops or college success courses as a possible prerequisite. Surveys of prerequisites and remediation at other colleges and universities would be helpful in starting the dialogue.

One interesting note from the study is the negative coefficient for student-reported ability with MS Word™. This sign was unexpected but may be due to students’ greater familiarity with Word™ than the other selected Microsoft Office™ applications (Excel™, PowerPoint™, and Access™). This familiarity with Word™ may lead students to overestimate their skills and abilities as compared to the other applications within the course based solely on the name recognition and general familiarity.

Further studies are needed on the design of the introduction to computers course. While beyond the scope of this study, there has been much discussion in schools of business that today’s entering students may have enough experience in computer applications from high school and/or work experience to omit all or part of the course. The business community agrees students need less computer theory and more application in Windows™, Word™, Access™, Excel™ and PowerPoint™ (Spinuzzi, 2006; Wilkinson, 2006). However, the academic community continues to debate the appropriate balance of theory and application, as well as the appropriate format for the course and whether it should be continued (McDonald, 2004; Stephens, 2006). A comparative article that profiles the structure of the course at various institutions is also needed, along with further discussion in the academic community. Further study of how the course is taught and organized at other colleges and universities would also be helpful for academicians.

Further replication and extension of this study too could determine the GPA cut-off point for remediation and study skills instruction prior to attempting the introduction to computers course. This study found students with a GPA of 2.1 or lower would earn either a D or F in the introduction to computers course, with those students with a 1.6 or lower earning an F. Further studies should attempt to validate this scale.

This study found overall student GPA to be a better predictor of the final course grade than the variables in the self-reported skills inventory. GPA was also a better predictor of performance in each of the various computer skills and packages lab and lecture modules. Further research is needed with a larger sample size, across additional time periods, and with samples from a variety of institutions to confirm the findings. If the findings continue to point to GPA as a better predictor over time, then the current stream of research in self-efficacy will need to be amended, as will the focus on various individual and combinations of demographic variables as predictors of course performance. Further research is needed to determine if targeted interventions to improve overall GPA would help the overall grades in the introduction to computers course.

APPENDIX B

Figure 1

- Student self-assessment of skills and abilities with Windows XP™ and selected Microsoft Office™ applications and related skills
- Student judgment of computer self-efficacy
- Student computer-related behaviors; e.g., persistence, class attendance
- Student’s final course grade
- Student demographic and experience factors available from the survey or college Banner™ system
APPENDIX C

ABRIDGED SYLLABUS

CLASS TEXT:

COURSE DESCRIPTION:
Assures a basic level of computer applications literacy to include spreadsheet, database, word processing, LAN, e-mail, presentation software, and Internet utilizations. This course satisfies the computer literacy requirement.

STUDENT LEARNING OUTCOMES:
To successfully complete this course, the student should achieve the following objectives:
1. Understand how information technology aids business decision making.
2. Identify the components of a typical microcomputer system.
3. Identify and describe the most widely used general microcomputer software applications, the difference between application software and system software and understand the role of operating system software.
4. Demonstrate knowledge of computer hardware and software, including “multimedia” and be familiar with the legal, ethical, and privacy issues relating to the use of hardware and software in a business environment.
5. Be familiar with computer networks and know the basic components of a communications system to include e-mail, user interfaces, communications, and the Internet.
6. Effectively use a word processing software program, a spreadsheet program, a database management program, and develop a simple presentation using a presentation software program.

These objectives will be measured through written tests, laboratory assignments, and laboratory tests.

ASSESSMENT SCALE:
A = 90 – 100  B = 80 - 89  C = 70 - 79  D = 60 - 69  F = < 60

ASSESSMENT:
Component                                                                 Percent of total grade
Lecture tests (3-4 @100 points)                                           60%
Lab and Other Assignments                                                15%
Lab tests                                                                 25%

100%

ATTENDANCE AND OTHER MATTERS:
Regular lecture and laboratory attendance is expected. If you miss a class, it is your responsibility to find out what you missed, including announcements of homework, lab assignments, test dates, etc. Exams are to be taken on designated test dates. No makeup tests for missed exams will be given, except in the case of extreme emergency and only with prior notification, if possible.
All assignments that have due dates are to be turned in at the beginning of the class meeting on the assigned due date. Late work will be accepted, but with a 10% penalty for each class day the work is late.
APPENDIX D

Survey Instrument

I have read, understand, and agree to abide by the policies established in this course.

My personal goals as an outcome of this class:

expected grade: __________

what I hope to achieve: ___________________________________________________________________

knowledge I expect to gain: ___________________________________________________________________

I can perform the following activities (check all that apply):

Operating System:

- Create text files
- Create folders
- Format disks with operating system (make a boot disk)
- Format disks without operating system
- Copy files
- Move files
- Create subfolders
- Capture a screen image
Word Processing:
___ Create a document
___ Set margins
___ Set Tabs (left, right, center, dot leader)
___ Center text
___ Bold text
___ Underline text
___ Add borders
___ Add shading
___ Import graphics
___ Create tables
___ Add headers
___ Add footers
___ Create page breaks
___ Print a document
___ Show formatting marks
___ Show reveal formatting task pane
___ Customize word processor toolbars
___ Change font characteristics
___ Inserting dates (static and dynamic)
___ Create a hyperlink
___ Create a bulleted list
___ Save a document
___ Save a document as a web page
___ Create endnotes and footnotes
___ Find and replace text
___ Align text in a document
___ Align text in a table

Spreadsheets:
___ Create a new workbook
___ Select a cell
   ___ Enter text in a cell
___ Justify text in a cell
___ Enter numbers
___ Change font type, style, size and color
___ Save a workbook
___ Create formulas to add, subtract, multiply, and divide cell contents
   Use built-in functions (e.g., SUM, MIN, MAX, AVERAGE)
___ Add shading and borders
___ Change column width and row height
___ Delete text in cells
___ Delete rows and/or columns
___ Copy cell contents
___ Move cell contents
___ Insert dates as text, as numbers, as system
Use relative, mixed and absolute addressing of cells
Create charts (both embedded and on a separate sheet)
Create X-axis, and Y-axis and Chart titles
Create an exploded pie chart
Name individual worksheets in a workbook
Make decisions using IF statements
Create static and dynamic web pages
Perform what-if analysis using
Goal-Seek

Databases:
Create a new database
Create tables
Create forms
Create reports
Create queries
Add, change, and/or delete data to/in/from a table
Create permanent relationships among tables
Enforce referential integrity
Specify cascade deletes and cascade updates
Create calculated fields
Specify validation rules for entering data
Apply filters to a query
Create a parameter query
Change the structure of a table
Save a database
Create an index
Create a primary key
Use wildcards in queries to search for certain records
Compact and repair a database
Backup a database
Use comparison operators to look up records
Use AND and/or OR operators in a query

Presentation Software:
Create a presentation file
Create slides in the presentation
Add graphics to the presentation
Create bullets
Change the background of the slides
Create animation effects
Add a new slide
Create a slide show
Check presentation for spelling errors
Create an outline
Print a presentation as slides, notes, and/or handouts
Please put your initials here: ____
