Abstract: This paper frames the recent ABET accreditation model with respect to the balance between IS programs and innovation. With the current relaxation of the content of the information systems requirement by ABET, it is possible to include innovation into the accreditation umbrella. To this extent this paper provides a curricular model that provides programmatic flexibility within the information systems environment that allows for innovation in the context of an accredited program. An innovative bachelor's degree program incorporating cyber forensics and information security is presented which can fit the ABET-CAC model for accreditation as an Information Systems degree. The paper argues for the usefulness of a cyber forensics security degree, and its positioning within the ABET accreditation framework.

Keywords: ABET, forensics, security, accreditation

This issue is on the Internet at **http://isedj.org/8/60/**

This paper was in the 2009 cohort from which the top 45% were accepted for journal publication. Acceptance is competitive based on at least three double-blind peer reviews plus additional single-blind reviews by the review board and editors to assess final manuscript quality including the importance of what was said and the clarity of presentation.

Cyber Forensics and Information Security as an ABET-CAC Accreditable Program

Abstract

This paper frames the recent ABET accreditation model with respect to the balance between IS programs and innovation. With the current relaxation of the content of the information systems requirement by ABET, it is possible to include innovation into the accreditation umbrella. To this extent, this paper provides a curricular model that provides programmatic flexibility within the information systems environment that allows for innovation in the context of an accredited program. An innovative bachelor's degree program incorporating cyber forensics and information security is presented which can fit the ABET-CAC model for accreditation as an Information Systems degree. The paper argues for the usefulness of a cyber forensics and information security degree, and its positioning within the ABET accreditation framework.

Keywords: ABET, forensics, security, accreditation

1. INTRODUCTION

In the past eight years, the total number of Information Systems (IS) programs attaining ABET-CAC accreditation has grown to 29. As the number of IS programs seeking accreditation is likely to increase, there is a need to assess not only the gains associated with the accreditation process, but also the potential unplanned negatives. This paper frames the recent ABET accreditation model with respect to the balance between IS programs and innovation. It can be argued that the ABET model focuses on Hardware, Software, and Data, with a lesser degree of attention to people and procedures. For instance, while business courses had been a required part of the ABET accreditation and,

since IS courses are not permitted to be counted as an IS Environment, there were no explicit requirements for IS related business courses in the information system environment (DeLorenzo, Kohun, & Wood, 2006). While the IS business related courses are not specified by ABET, most accredited programs use essentially the same mix of business core courses. This has resulted in a degree of *de facto* standardization in accredited programs. However, with the current relaxation of the content of the information systems requirement by ABET, it is possible to include innovation into the accreditation umbrella. To this extent, this paper provides a curricular model that provides programmatic flexibility within the information systems environment that allows for innovation in the context of an accredited program.

2. INFORMATION SECURITY – BRIEF HISTORY

"Information security" is not new; it has been used at different forums and introduced from different perspectives. Leeuw (2007) noted that the origin of information security dates back to when the scientific information became widely acknowledged and the need rose to safeguard this knowledge from being acquired or used by others without having the prior authorization. Innella (2008), in contrast, explained that the introduction of the Internet provided the spark which led to increasing the use of Information Security. The same author discussed the Defense Advanced Research Project Agency's (DARPA) initiatives in 1969 to design a network through which data could be passed and received. Some of these data were sensitive and this led to establishing procedures for sharing sensitive information on the network and devices to protect the information from being stolen.

Although the Internet led to increase the sharing of information, which increased the use of information security, the swell of information security programs at academic institutions was not witnessed until the turn of the century. The wide spread use of business transactions electronically placed more urgency on delivering this information accurately. This added to the importance of finding people who can protect this information. Academic programs realized this need and

started different programs and courses to train people in such skills.

3. INFORMATION SECURITY IN ACADEMIA

According to Innella (2008), securing computer networks had its roots in the 1960s when computers were connected through dumb terminals via networks and information was exchanged through the network. Computer academic programs started initially teaching computer security in small doses; in a chapter or a few chapters in a book or by covering computer security with other topics in the same course. Later, development increased the volume at which information security is taught at academic programs. Currently, nearly all computer programs have at least one course or topic that is devoted to teaching computer or information security in one form or another. Often, an entire degree is devoted to teaching information security.

Governmental support for academic programs in information security has increased greatly in recent years. This support is exemplified in the establishment of the National Centers of Academic Excellence in IA Education (CAEIAE) by the National Security Agency (NSA) and the Department of Homeland Security (DHS). In 1999, the goal of these centers was " . . . to reduce vulnerability in our national information infrastructure by promoting higher education and research in IA and [by] producing a growing number of professionals with IA expertise in various disciplines (National Security Agency, 1999)." In the first year of the center, seven universities were designated with this status of excellence. The number of universities with this status has steadily increased since 1999, due to the increased demand for graduates trained in information security.

According to Frost & Sullivan (2008), technology by itself does not solve security problems; people must be trained on the use of technology in order to properly use it to solve anticipated problems. In a survey of 7,548 information security professionals conducted by Frost & Sullivan to study the status of jobs available in information security, the authors estimated the number of information security professionals employed worldwide to be approximately 1.66 million in 2007. The number of available positions is

expected to increase to almost 2.7 million professionals by 2012. This increase from 1.6 million to 2.7 million represents a 10% increase each year from 2007 to 2012.

Such increase in demand for information security professionals adds more pressure on academic programs to meet the increasing demand for such personnel. Information systems and information technology programs made consistent modifications to their programs to include information security in an effort to keep pace with the demand for such professionals. The continuing modifications are more apparent in the representation of information security in IT model curriculum. The earlier version of these model curricula hardly suggested the inclusion of information security in their suggested topics. However, later versions suggested the inclusion of courses as well as specific programs in information security.

4. INFORMATION SECURITY IN THE MODEL CURRICULA

Many organizations work to model curricula for various technology fields, such as: The Association for Computing Machinery (ACM), Institute of Electrical and Electronics Engineers (IEEE), the Association of Information Systems (AIS) and the Association of Information Technology Professionals (AITP). These organizations have worked at many levels to develop model curricula for different computer disciplines. These organizations have developed a number of documents in this regard and indicated that they will continue to do so as the need arises. The initial focus of these efforts was to develop a model curriculum for computer science programs. This focus evolved into a larger number of model curricula to cover a wider range of computer related programs.

The documents that are developed by these organizations are labeled as computing curricula. Though not officially considered "standards," these documents have been widely used in curriculum development and accreditation. In fact, due to their wide use in higher education, these documents are considered as the de facto standard or the "pseudo standard" curricula in the computing technology fields.

The latest incarnation of these model curricula include IS2002, CC2005, IT2005 and IT2008.

IS2002

IS2002 (Gorgone et al., 2002) included a table titled "Representative Capabilities and Knowledge Expected for IS Program Graduates." This table included four areas, including technology. Under the technology heading, the table lists Database Design and Administration. Beneath the table, the topic of "Administration, security, safety, backup, repairs, and replicating" are suggested as topic coverage areas.

In addition to the representative capabilities figure, IS2002 included 12 learning units. Each of these units can serve as courses in traditional IS programs. Security was mentioned as a topic of coverage under two learning units: IS 2002.1 – Fundamentals of Information Systems and IS 2002.2 – Electronic Business Strategy, Architecture and Design.

CC2005

The development of Computing Curriculum 2005 (CC2005) served two purposes: First, it identified the fields or the academic programs that encompass computer related programs. Second, it listed specific fields that are included under each domain.

CC2005 identified five computer related programs: Computer Science (CS), Information Systems (IS), Information Technology (IT), Computer Engineering (CE) and Software Engineering (SE). Along with the five technology fields, CC2005 provided a scoring mechanism for the coverage (or domain) area for these five technology fields. Although there is some overlap in the coverage area among these five fields, CC2005 provided ample descriptions of each of the coverage areas.

One of the tables included in CC2005 provides Comparative weights of computing topics across the five kinds of degree programs mentioned above. Two topics were mentioned in the table regarding security: Security Issues and Principles, and Security Implementation and Management. Both of these categories were present in computer engineering, computer science, information systems, information technology, and software engineering.

IT2005, IT2008

Both the IT2005 and IT2008 standard curricula have been developed regarding the latest emerging field of information technology. Information Assurance and Security are listed as one of 12 knowledge areas included in the body of knowledge for this field. In addition, Information Assurance and Security is included as one of the "Pervasive Themes" that are prominent in all of the knowledge areas.

5. ABET-CAC INFORMATION SYSTEMS ACCREDITATION

Previous research was analyzed by examining ABET IS accreditation. Areas analyzed included the value in receiving accreditation, the value in positioning the program in the school of business, and ABET IS's relationship to AACSB accreditation. The review included an analysis of the prior work on ABET IS accreditation by Gorgone, Hilton, Jones, Lidtke, and MacKinnon. (DeLorenzo et al., 2006).

As noted by Hilton (2003), MIS programs in a business school " . . . [provide] business graduates with [adequate] education in a major change lever" and " . . . ensure that a large number of technology professionals are adequately educated in basic business concepts." ABET accreditation of an MIS department housed within a college of business would only increase the credibility and quality of both the department and the college. However, as noted by Jones (2004), ABET IS accreditation presents curriculum challenges on the balance of business and IS courses for those programs seeking AACSB accreditation. Given the recent national decline in IS majors and the inclusion of typical IS curriculum into mainstream business majors (i.e., database, data mining, systems analysis, web design), IS curricular innovation is needed in order to attract students, including women. One proposed strategy is to include an information systems environment that is an area of interest to the current contemporary population of young adults.

One area of interest that has attracted national attention is forensics. What follows is a curriculum offered at a mid-Atlantic university that combines the core requirements and focus of an ABET-CAC IS accreditable curriculum with a focus on cyber forensics and (its counterpart) information security.

Cyber Forensics

Cyber Forensics is an emerging discipline offering significant career opportunities. Professionals in this discipline combat identity theft, corporate theft, cyber terrorism, and the exploitation of minors. To meet the current and growing need of these professionals, a hybrid program was created incorporating the needs of cyber forensics, and those of information security. The proposed degree is a Bachelor of Science in Cyber Forensics and Information Security. Possible careers include private industry, government (including law enforcement), and the legal profession.

As new technological innovations continue to proliferate in our society, so do the opportunities for technology exploitation. Once the purview of a few "geeks" and "hackers," cyber and computer crime has evolved to include a large following of increasingly sophisticated and organized criminals. As cyber crime continues to expand, the need for highly-skilled professionals in cyber and computer forensics also increases.

6. CYBER CRIME

Corporate/Business Theft

A recent survey of 494 U.S.-based companies found that the average annual loss per company due to cyber crime jumped to $550,424 during 2006. This increase in corporate loss more than doubled from the 2005 estimate of $168,000 (Kelly, 2007). There are several trends within corporate cyber crime that contribute to this increase in losses. First, the very nature of the cyber criminal has changed. Early attacks against corporate networks and databases were more of a nuisance, causing temporary loss of business and minor financial consequences. The cyber thief of the mid to late 2000s, however, has designed extremely organized attacks that yield larger monetary payoffs for the criminal. Also, the attacks are far more insidious than those of the past, making the attacks extremely difficult to detect and also making the resulting financial loss more substantial (Sherstobitoff & Bustamante, 2007).

Due to the increasing risk to cyber theft, corporations are under an increasing bevy of regulatory requirements from government and quasi-government agencies. Federal mandates such as Sarbanes-Oxley have required U.S. corporations to address cyber security and tighten all potential exploits. Specifically, the central role of the Information Technology (IT) department has shifted ". . . from technology to corporate governance. Government mandates and compliance issues continue to be a hot topic within the IT department" (D'Amico, 2007, p. 29).

Since cyber crime in corporate America directly affects profits, ". . . cyber security is becoming more of a boardroom issue." (D'Amico, 2007, p. 29). To help fight the growing liability of cyber crime, business organizations need to employ people who have both business acumen and the necessary technology skills for mitigating cyber attacks.

Personal Property/Identity Theft

Advances in technology have dramatically increased the storage capacity and availability of personal information. Our networked-lives have made socializing, purchasing, banking, and healthcare convenient; however, this interconnectivity has also exposed private citizens to identity theft and other vulnerabilities. In 2007, the theft or loss of personal information in the United States alone, such as credit card data and Social Security data, climbed to record levels. A 2007 study found that 79 million personal records were reported as compromised; a statistic that is nearly four times the volume reported for 2006 (Associated Press, 2007).

A recent incident involving TJX Cos. (the parent company of T.J. Maxx and Marshalls department stores) shows the vulnerability of private consumers' data. During the "hack" of its network and associated databases, TJX acknowledges that up to 46 million private records (i.e., credit card numbers) were compromised. Third-party consumer groups have estimated this number to be much higher; as much as 94 million (Associated Press, 2007).

Consumer advocacy groups, as well as law firms representing both private and class-action suites need skilled individuals who understand the technical intricacies involved

in identity theft cases. In addition, local, state, and federal laws and regulations need to be updated to combat cyber crime and prosecute offenders. Again, highly-skilled individuals must be hired to aid in this effort.

Cyber Terrorism

Cyber terrorism takes cyber crime to a whole new level. Unlike traditional cyber crime, the motives of cyber terrorism are social, political, or religious. Cyber terrorism can be financially motivated, however, most attacks are designed to deny service or compromise key infrastructure systems.

Since virtually all infrastructure systems are computer-controlled or linked via networks, any type of system could be at risk. In an attack, cyber terrorists could sabotage or cripple mundane systems such as electricity, telephone, and automated banking. However, cyber terrorists could also target more critical systems, such as public water supplies, air traffic control systems, and military defense systems (Wagner, 2007).

The U.S. Department of Defense considers the Internet and cyberspace as the "fifth operating domain for war fighting" and adds that cyber terrorism attacks could range from ". . . simple disruption of communications systems to loss of combat capability" (Wagner, 2007, p. 35).

As the United States and allies work to tighten physical security, terrorists may favor cyber attacks that bypass physical security measures. Although, a full-scale "cyber jihad" has not yet been launched, there have been sporadic attempts by extremists in the Middle-East and China to infiltrate U.S. systems. As expected, terrorist cells in different geographic locations use the Internet to communicate and to distribute plans and information.

Monitoring terrorist communications and securing critical private and governmental systems from cyber attacks requires a growing arsenal of professionals. Local law enforcement and government, as well as state, and federal levels all require a growing number of individuals who have the technical expertise to guard our cyber-borders. As these monitors are given more power, it may be necessary to also increase the need to monitor the monitors, protecting from abusing this power.

Exploitation of Minors

Finally, among the most heinous of cyber crimes involve the exploitation of children. Criminals in this realm can be involved in crimes ranging from child pornography to abduction, molestation, and murder of children.

Unfortunately, the connectivity of the Internet and the proliferation of social sites such as MySpace and Facebook have spawned a whole new medium for child predators. Recent FBI crime statistics show that six out of ten children who are online have received an e-mail or instant message from a total stranger. Even more alarming, approximately one in every 33 children who are online will be coaxed by a stranger to meet in person (Murphy, 2008).

Online websites, chat rooms, and Internet Service Providers (ISPs) must continue to work with legislators and all levels of law enforcement to fight against child predators and protect children while they are online. A growing number of highly-trained and skilled individuals are needed in the private and public sectors to prosecute child predators and to make cyberspace safe for everyone.

7. B.S. IN CYBER FORENSICS AND INFORMATION SECURITY

Program Outcomes

When a student successfully completes all requirements for the B.S. in Cyber Forensics and Information Security, he/she will be able to . . .

1. Demonstrate the proper use of cyber forensic tools and techniques.

2. Describe and be able to follow proper investigatory and legal procedures pertaining to cyber forensics.

3. Properly report the findings of a cyber forensic investigation in both written form (using proper grammar, writing style, and citation) and in oral form (i.e., within the context of a trial, hearing, or deposition).

4. " . . . understand, apply, and manage information assurance and security in computing, communication, and organizational systems." (Ekstrom et al., 2006, p. 355).

ABET-CAC provides curricula guidelines through its Criterion 1 Program Outcomes. As per the ten prescribed outcomes, an IS student successfully completing an ABET-CAC-accredited curriculum will be able to: a) apply knowledge of computing and mathematics appropriate to the discipline; b) analyze a problem, and identify and define the computing requirements appropriate to its solution; c) design, implement and evaluate a computer-based system, process, component, or program to meet desired needs; d) function effectively on teams to accomplish a common goal; e) understand professional, ethical, legal, security, and social issues and responsibilities; f) communicate effectively with a range of audiences; g) analyze the local and global impact of computing on individuals, organizations and society; h) recognize the need for, and an ability to engage in, continuing professional development; i) use current techniques, skills, and tools necessary for computing practices; and j) understand processes that support the delivery and management of information systems within a specific application environment.

The individual course outcomes from the key courses in the Cyber Forensics and Information Security degree map to the four aforementioned Program Outcomes. Further, the four Program Outcomes map directly to the ten prescribed ABET-CAC Program Outcomes for IS curricula. The mappings of course outcomes to program outcomes, and the mapping of program outcomes to ABET-CAC program outcomes are depicted in Appendix A: MAPPING OF COURSE OUTCOMES, PROGRAM OUTCOMES, AND ABET-CAC PROGRAM OUTCOMES. The specific titles of all courses contained in the proposed program are found in Appendix B: CYBER FORENSICS AND INFORMATION SECURITY PROGRAM.

In summary, this paper has presented a way to use the existing ABET accreditation standards to present a program in Cyber Forensics and Information Security. This new and innovative program will enable graduates to meet the needs of industry while satisfying academic excellence standards.

APPENDIX A

MAPPING OF COURSE OUTCOMES, PROGRAM OUTCOMES, AND ABET-CAC PROGRAM OUTCOMES

Key Course/Course Outcome(s)	Program Outcome(s)	ABET-CAC Criterion 1 Program Outcomes
POLS2020 – Criminal Law & Evidence **Outcome(s):** Cite and apply the methods that the U.S. and local governments use to detect, investigate, apprehend, prosecute, convict, and punish criminals	2. Describe and be able to follow proper investigatory and legal procedures pertaining to cyber forensics.	e. An understanding of professional, ethical, legal, security, and social issues and responsibilities. j. An understanding of processes that support the delivery and management of information systems within a specific application environment.
CRIM 2000 – Criminology **Outcome(s):** Discuss and give examples of criminal law, major types of crime, and leading criminological theories.	2. Describe and be able to follow proper investigatory and legal procedures pertaining to cyber forensics.	e. An understanding of professional, ethical, legal, security, and social issues and responsibilities. j. An understanding of processes that support the delivery and management of information systems within a specific application environment.
INFS 3190 – Digital Evidence Analysis **Outcome(s):** Discuss applicable laws related to the search and seizure of all types of evidence, including digital and multimedia. Demonstrate the proper legal procedures for investigating cybercrime and other incidents involving the wrongful use of technology. Discuss and demonstrate proper courtroom, hearing, and deposition testimony.	2. Describe and be able to follow proper investigatory and legal procedures pertaining to cyber forensics. 3. Properly report the findings of a cyber forensic investigation in both written form (using proper grammar, writing style, and citation) and in oral form (i.e., within the context of a trial, hearing, or deposition).	e. An understanding of professional, ethical, legal, security, and social issues and responsibilities. d. An ability to function effectively on teams to accomplish a common goal. f. An ability to communicate effectively with a range of audiences. g. An ability to analyze the local and global impact of computing on individuals, organizations and society.

Key Course/Course Outcome(s)	Program Outcome(s)	ABET-CAC Criterion 1 Program Outcomes
INFS 3120 – Computer Forensics **Outcome(s):** Demonstrate the use of various computer forensic software tools as well as follow proper legal procedures for obtaining, analyzing, and reporting digital forensic evidence	1. Demonstrate the proper use of cyber forensic tools and techniques. 2. Describe and be able to follow proper investigatory and legal procedures pertaining to cyber forensics. 3. Properly report the findings of a cyber forensic investigation in both written form (using proper grammar, writing style, and citation) and in oral form (i.e., within the context of a trial, hearing, or deposition).	a. An ability to apply knowledge of computing and mathematics appropriate to the discipline. e. An understanding of professional, ethical, legal, security, and social issues and responsibilities. f. An ability to communicate effectively with a range of audiences i. An ability to use current techniques, skills, and tools necessary for computing practices.
INFS 3170 – Cyberlaw **Outcome(s):** Identify and analyze legal issues within technology, such as: on-line contracts, computer crime, fraud, privacy, defamation, hate speech, indecency, obscenity, cyber- squatting, and intellectual property.	2. Describe and be able to follow proper investigatory and legal procedures pertaining to cyber forensics.	e. An understanding of professional, ethical, legal, security, and social issues and responsibilities. j. An understanding of processes that support the delivery and management of information systems within a specific application environment.
INFS 4180 – Network Forensics, Intrusion Detection, & Response **Outcome(s):** Demonstrate various techniques for preventing unauthorized attacks to computer networks and apply measures for minimizing the damage caused by network intruders.	1. Demonstrate the proper use of cyber forensic tools and techniques. 4. Understand, apply, and manage information assurance and security in computing, communication, and organizational systems	b. An ability to analyze a problem, and identify and define the computing requirements appropriate to its solution. c. An ability to design, implement and evaluate a computer-based system, process, component, or program to meet desired needs. e. An understanding of professional, ethical, legal, security, and social issues and responsibilities. h. Recognition of the need for, and an ability to engage in, continuing professional development.
