The **Information Systems Education Journal** (ISEDJ) is a double-blind peer-reviewed academic journal published by **ISCAP** (Information Systems and Computing Academic Professionals). Publishing frequency is five times per year. The first year of publication was 2003.

ISEDJ is published online (https://isedj.org). Our sister publication, the Proceedings of the ISCAP Conference (https://iscap.us/proceedings) features all papers, abstracts, panels, workshops, and presentations from the conference.

The journal acceptance review process involves a minimum of three double-blind peer reviews, where both the reviewer is not aware of the identities of the authors and the authors are not aware of the identities of the reviewers. The initial reviews happen before the ISCAP conference. All papers, whether award-winners or not, are invited to resubmit for journal consideration after applying feedback from the Conference presentation. Award winning papers are assured of a publication slot; however, all re-submitted papers including award winners are subjected to a second round of three blind peer reviews to improve quality and make final accept/reject decisions. Those papers that are deemed of sufficient quality are accepted for publication in the ISEDJ journal. Currently the target acceptance rate for the journal is under 35%.

Information Systems Education Journal is pleased to be listed in the Cabell's Directory of Publishing Opportunities in Educational Technology and Library Science, in both the electronic and printed editions. Questions should be addressed to the editor at editor@isedj.org or the publisher at publisher@isedj.org. Special thanks to volunteer members of ISCAP who perform the editorial and review processes for ISEDJ.

Abstract

In 2020, the IEEE/ACM Computing Curricula 2020 report, the ACM/AIS/ISCAP Undergraduate Model Curriculum, and the AASCB Standards for Business Accreditation were all released. Each expands on its predecessor to add aspects of disposition to the knowledge, skills, and capabilities in its curriculum. This curriculum is then used to shape, hone, and prepare graduates. Both the CC2020 and IS2020 reports specifically recommend a competency-based curriculum in which dispositions are both a relatively new addition as well as an addition that may be fraught as the consideration and/or adoption process proceeds. The competency model challenges Information Systems curriculum design in two key aspects that are the subject of this paper. First, the "disposition" dimension poses key challenges in the Information Systems discipline and provides a new area of focus in the literature on Information Systems curriculum development. Second, the inclusion of dispositions in the CC2020/IS2020 competency model provides an opportunity to explore interconnections that can be more informative than course containers, course descriptions, and lists of topics. We promote the uptake of the CC2020/IS2020 competency model by focusing on and advocating for dispositions as a means of accounting for, and designing for, students' becoming as a complement to students' application of skills and knowledge in the task environment. The "disposition" component of the competency model promises extended expression, facility of comparison, and clarity in exchange to bring utility and understanding in the Information Systems curriculum development process.

Keywords: professionalism, competency, mindset, dispositions, accountability, computing education, curriculum design.

On Becoming: Why Disposition Distinguishes Information Systems Education from Training. A Commentary on Model Curricula

Jeffry Babb, David Yates and Leslie Waguespack

1. INTRODUCTION

Recent computing curricula reports (CC2020), and specific disciplinary model curriculum reports (CC2020, IS2020, and the impending CS2023 and DS2023) have been authored using a competency approach to modeling computing curricula. A key component of the models in these reports is the inclusion of dispositions. The CC2020 report conceptualizes dispositions thusly (CC2020, p.134): Dispositions enfold intellectual, social, and moral predilections or tendencies that influence behaviors that do not lend themselves as easily to a categorical assessment. From our read of this statement and our experience, we find that dispositions relate to habitual behavioral tendencies that best facilitate the development of the skills and knowledge that support competencies. Thus, with the inclusion of dispositions, which are often considered subjective, some will find pathways for measurement and assessment to be less clear. This presented opportunities for friction and for growth. Others have conceptually drawn from dispositions in computing curriculum development and we review these next.

Knowledge Areas, Knowledge Units, and Learning Outcomes (KA, KU, LO) were common ontological organizations in model curricula development 20 years ago. While they are still useful to articulate the knowledge elements and skills levels inherent in the CC2020 competency model, these elements (KA, KU, LO) can usually be directly observed: a developed algorithm, a security policy, a normalized schema, or UX design. However, the potentially fraught and beneficial aspect of the CC2020 and IS2020 competency the inclusion of dispositions. model is Dispositions, which at first seem immediately familiar, quickly become inscrutable as they must be explicated, articulated, and reconciled as mediators and moderators of the full competency expression; more so when a competency expression attempts to match a given task environment.

Dispositions are arguably a matter of the affective cognitive realm (Ben-Ze'ev, 1997) and arguably

occupy a similar space as that of Covey's (2020) seven habits. Like Covey's habits, dispositions may be understood as conditions, or habits of mind, which assist in problem framing and solution design. When we enter the behavioral and affective realm of dispositions in the competency model, they may strike some as being apart from the more concrete elements of computing knowledge.

Computing accreditors, such as ABET, do not shy away from specifying attention to sociologic and behavioral psychologic realms in their criteria for computing programs. However, the authoring and pedagogical implementation of dispositions remains relatively new ground in model curricula for Information Systems. That is, we are used to students' demonstration of computing knowledge and ability, via observable artifacts, and less so from the enabling habits and attitudes that facilitate those competencies.

In this paper we will explore the essential nature of the "disposition" component of the competency model and suggest that the investments in these dimensions of competencies can be meaningful and long-lasting as students progress in their careers. In this sense, we advocate that dispositions serve as a "glue" used to adhere the vital component of a competency's contextual application in a task environment to the foundational knowledge needed to facilitate computing solutions. We use this forum not as a traditional research paper, but as an outlet for our thinking about the role of disposition in computing education, based on the foundational elements of literature review and meta-analysis.

Dispositions may not be a common element in many skills-oriented technical courses and curricula. Also, other related disciplines (e.g., psychology) may be assumed to be addressing the basic principles of habit and behavior. Thus, it is likely that dispositions and their importance can be missed in the development of competencies. Whereas recent guidance from model curricula (IS2020) or accrediting bodies (the ABET CAC Criteria) place a firm emphasis on the indelible and concrete technical knowledge and skills, the benefit of examining the seemingly esoteric role of dispositions is the appeal made in this paper. Dispositions are vital as they reflect the knowing-in-action (Schön, 1995) that can be best shaped by discovering both explicit and implicit purposes and placement of disposition in competency expressions of curricula.

Lastly, this paper proposes that the lasting value of dispositions is their reflection of the evergreen habits of orientation, perspective, and framing that are the hallmarks of reflective practice of an IS professional (Brown, 1995; Rein and Schön, 1996). We hope that the reader will develop a greater appreciation for the potential, pitfalls, and nuances possible with care for the value that dispositions bring to the table in the CC2020/IS2020 competency model.

The paper proceeds as follows. First, we examine the purpose and placement of dispositions within the competency model. We next review the literature on dispositions regarding competencies in computing curriculum development. We next explore how the CC2020 competency model was manifested in the IS2020 model curriculum with some text analytic techniques. With that, we next postulate on what typical challenges would be encountered in specifying dispositions during competency development. We conclude with potential benefits and purposes of dispositions with regard to overarching goals for academic computing programs and the student outcomes they facilitate.

2. THE SIGNIFICANCE OF DISPOSITION IN COMPETENCY

CC2020 asserts that adopting its competency model enables educating, prescribing, and evaluating a practice of computing that delivers a broad range of practical benefits: to students, benefactors, faculty, administrators, employers, accreditors, lawmakers, and society.

"Describing computing competence in a practical context shifts the focus of curricula away from describing a body of knowledge in relation to a disciplinary area and channels it toward pragmatic [...] accomplishment and performance. It challenges [... developing ...] proficient computing professionals, and it allows society to recognize the purpose and benefits of [... computing ...] within a competency framework." (CC2020)

Indeed, at the CC2020 project's inception in early 2017 the capability and character of "proficient computing professionals" fused as the driving

the technical curriculum with a more comprehensive model, that of competent professional action and conduct (see Figure 1). CC2020's model of competency categorically represents professional action and conduct as "knowing what," "knowing how," and "knowing why."

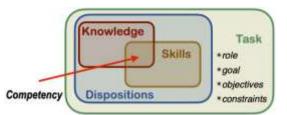

Figure 1: Competency = [Knowledge + Skills + Dispositions] in Task (Clear & Parrish et al., 2020).

The new, key element is **disposition** that explicitly fuses action and conduct to the effect of purposeful behavior.

disposition ... Natural tendency or bent of the mind, esp. in relation to moral or social qualities; mental constitution or temperament; turn of mind... (Oxford English Dictionary)

Disposition's role in competency (both formative and performative) requires delineating traits that characterize "professionalism." In concert these traits commonly interpret a "professional **mindset**." CC2020 elaborates their formative intention of disposition in competency as follows:

The meta-language of competency, "knowing what," "knowing how," and "knowing why," crisscrosses domains of scientific fact, practiced behavior. and cultural norms. Scientific (technically rational) fact and practiced behavior lend themselves to a categorical assessment: true or false, present or absent, consistent or inconsistent, it works, or it doesn't. Dispositions enfold intellectual, social, and moral predilections or tendencies that influence behaviors that do not lend themselves as easily to a categorical assessment. These predilections reflect value judgements that are not amenable to scientific proof. Values may differ or be held differently among individuals or cultures. And value

judgements are also often mutable over time affected by the experience of practice!

Dispositional expectations enrich the description/assessment of competency and/or the related pedagogy. Ascribing a disposition to a competency indicates a clear commitment to selfreflection and a sober examination of mission, goals, and objectives to reach the clarity that enables its effective integration in curriculum design, the agency of pedagogy, and the character of professionalism.

Disposition is an area that clearly distinguishes competency from a learning outcome and is an essential characteristic of a well-structured competency. As such it represents [a richer description of learning goals], and adds language common to professional expectations. However, when used in free form, such terms may easily become vague or difficult to interpret. This is where the specification of a competency-that is the combination of the free-form text with its constituent K+S+D in [Task] framing—becomes more valuable. The competency statement is prose that succinctly conveys the essential intention of curricular details, while the structured enumeration of the K-S pairs and D elements conveys intention in action (CC2020 p. 134).

Discerning and incorporating disposition in a competency specification of computing actions and conduct described in practice, empowers agencies of licensure, managers, educators, and communities to formulate, recognize, and effectively assert a whole of values and commitments that they deem characteristic to the judgement and conduct of a practitioner who is worthy of trust and respect as a professional.

The CC2020 decision to enfold dispositions to stipulate the character of professional practice clearly articulates what distinguishes educating computing professionals from training computing practitioners.

train ... To subject to discipline and instruction for development of character, behavior, or skill... To give sustained instruction and practice to... (Oxford English Dictionary)

educate ... To teach (a child) a program of various academic and non-academic subjects, typically at a school; to provide with a formal education.

(Oxford English Dictionary)

3. DISPOSITIONS IN THE LITERATURE

Since 2017 (Clear, 2017; Sabin, et al., 2017), the benefits of recognizing dispositions and task context in competency statements for computing curricula have become more obvious (Frezza, Daniels, Pears et al., 2018; Takada, Cuadros-Vargas, Impagliazzo et al., 2020). Furthermore, developing and including dispositions in competency statements is critical to advancing the use of competencies for describing the goals of tertiary education. In part, dispositions serve as a lens through which student behavior can be observed (Frezza, Clear & Clear, 2020; Watson, Besmer, Banks et al., 2021). In a professional setting, dispositions are observed in relation to conceptual and procedural knowledge (Billing, 2007). This study intends to understand and advance the development and inclusion of dispositions in competency statements.

To understand to what extent and where the dispositions proposed in the CC 2020 report (Clear & Parrish et al., 2020) appear in the literature, we formulated queries in Google Scholar for four major publication outlets. The primary audience for these outlets is educators in three computing disciplines, i.e., computer science, electrical engineering, and information systems. Appendix B shows the number of publications for each disposition that appeared in the *ACM Transactions on Computing Education* (ToCE), *IEEE Frontiers in Education* (FIE), ISCAP *Information Systems Education Journal* (ISEDJ), and ISCAP *Journal of Information Systems* (JISE).

Appendix B also shows that all dispositions have been studied, albeit to different degrees. Being collaborative or professional has been studied most frequently in these outlets whereas being meticulous or passionate has been studied least frequently. The Google Scholar search queries for these dispositions are described in Figures 2 and 3. Most of these articles were published in the last ten years; for example (Cabo, 2021; Frezza & Adams, 2020; Groeneveld, Vennekens & Aerts, 2021; Jacob, Montoya, Nguyen & Warschauer, 2022; Knestis, Cheng, Fontaine & Feng, 2022; Podeschi & DeBo, 2022; Waguespack, Yates & Babb, 2022; Wijeratne, Dennehy, Quinlivan et al., 2022) have appeared since 2019. However, many relevant articles appeared before 2010, e.g. (Bryant, Campbell & Kerr, 2003; Graham & 2002; Guthrie & Navarrete, 2004; Caso, Richards, 2009; Saulnier, 2005; Sterling & Brinthaupt, 2003; Urquiza-Fuentes & Velázquez-Iturbide, 2009; Williams & Upchurch, 2001).

From the more than 2,000 articles counted in Appendix B, we wanted to discern the areas in which the authors had focused their research on dispositions. To do this we identified the six articles that Google Scholar considered most relevant for each of the dispositions and each of the publications in Appendix B. The result of this bibliometric analysis yielded 138 articles. Thirtyfour of these articles appeared in ACM ToCE, 41 in FIE, 33 in ISEDJ, and 30 in JISE. The 25 words that appeared most frequently in the titles of these articles appear in Table 1. Several of the words in Table 1 reflect the fact that the audience of our four publication outlets are educators, e.g., learning, education, students, teaching, course(s), curriculum, and knowledge. Most of the other words are commonplace when describing computing disciplines, e.g., computing, engineering, computer, information, systems, programming, science, technology, etc.

Words in Article Titles (see Appendix C)	Word Frequency
Learning	43
Education	25
Students	24
Computing	23
Engineering	20
Computer	18
Information	16
Systems, Teaching	15
Course, Programming, Skills	14
Curriculum, Development	13
Assessment, Courses, Student	12
Study	10
Online, Science, Technology	9
Knowledge, Professional, Project, Thinking	8

Table 1: Word frequency distribution fortitles resulting from bibliometric analysis.

We also wanted to visualize the 138 article titles in word clouds to understand what themes (not just words) appeared most frequently. The first diagram in Appendix D extends Table 1 from 25 words to 50 words. The words in yellow and orange in this figure add insights beyond those derived from the data in Table 1. For example, the word "design" reminds us that computing disciplines are disciplines of design (Brooks, 2010), including information systems (Babb, Waguespack & Abdullat, 2019). The word "attitudes" reminds us that most of the published computing education work in frames competencies in the language of knowledge + skills + attitudes (Volman, van Eck, Heemskerk & Kuiper, 2005) rather than knowledge + skills + dispositions (Clear & Parrish et al., 2020; Sabin,

et al., 2017). Also, that "professional" and "collaborative" are the only two dispositions that appear by name in The first diagram in Appendix D is consistent with the fact that these are the most studied dispositions listed in Table 2.

A word cloud analysis provided an additional perspective by considering both phrases and words. The most common word in our article titles - learning - isn't just about student learning. "Learning" also appears in article titles that refer to problem- or project-based learning [seven articles, e.g., (O'Grady, 2012; Woodward, Sendall & Ceccucci, 2010)], self-directed learning [two articles (Johnson, Ulseth, Smith & Fox, 2015; McCartney, Boustedt, Eckerd et al., 2016)], and learning enhanced by reflection (Barroso & Morgan, 2012) and technology (Motschnig-Pitrik, Kabicher, Figl & Santos, 2007). We saw in Table 1 that "information" (row seven) and "systems" (row eight) occur at about the same frequency. However, these words often appear as part of the phrase "information systems" (IS), referring to IS course(s), IS curriculum, and IS education, for example, as in (Saulnier, 2009; Nwokeji, Stachel, Holmes & Orji, 2019; Topi, 2019).

4. DISPOSITIONS IN IS2020

The IS 2020 report (Leidig & Salmela et al., 2020, p. 38) argues that dispositions are essential components of competency statements, because there "is often a character and quality of application inherent in the domain and context of application that suggests the qualifiers inherent to that domain." IS2020 goes on to refer to the computing-of-x and x-computing phenomena where most non-computing disciplines will recognize an indispensable need for a computing element within them – and suggests that demand for the contextualized use of knowledge-skill pairing in IS will continue to rise in the years ahead (p. 38). This will be necessary to support computing as it becomes ubiguitous across nearly all aspects of society, organizations, government, and business, in a process often referred to as digitalization. Dispositions are the adjectives that bring the socio-technical aspects of technology use to bear" (pp. 38-39). Leidig and Salmela et al. (2020) go on to enumerate 178 competencies in the report (pp. 95-182), including their knowledge-skill pairs and "key dispositions" (p. 97).

For each of the dispositions in Appendix B, we ran Google Scholar queries to count the papers in each of our four publication outlets. For each disposition, we included synonyms and adjacent concepts from Clear & Parrish et al. (2020) and Leidig & Salmela et al. (2020) in the queries. We also distinguished articles that included the term "attitudes" as an alternative to "dispositions." For example, Figure 2 shows the knowledge, skills, and dispositions (K-S-D) query for collaborative in IEEE Frontiers in Education. Similarly, Figure 3 shows the knowledge, skills, and attitudes (K-S-A) query for collaborative in the Information Systems Education Journal. Finally, Table 2 lists the dispositions, synonyms, and adjacent concepts used in these 88 queries.

knowledge skills dispositions collaborative OR "team player" OR influencing source: IEEE source: "Frontiers in Education"

Figure 2: Example user interface and Google Scholar syntax for K-S-D query for *collaborative*.

To help faculty, administrators, and professionals make sense of so many key dispositions, the IS 2020 report authors group them into the six competency realms shown in Figure 4. Since each competency names three key dispositions, Figure shows 534 in total (the numbers in 4 parentheses). For example, Systems Development specifies that a subset of the 11 dispositions in Table 2 are "key" for the 64 competencies within this competency realm. Hence, Systems Development explicitly requires 192 key dispositions, in aggregate, because each of these competencies includes three key dispositions. These dispositions, when tallied, appear in the proportions shown in Figure 4. A further elaboration in the Systems Development realm is shown in Figure 5.

Table 2: Dispositions, synonyms, andadjacent concepts used in queries toidentify relevant articles.

Note that Figure 6 shows that the report suggests that being purpose-driven, meticulous, inventive, and self-directed are most important when learning and practicing the competencies within Systems Development.

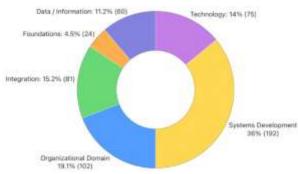

Figure 4: Distribution of key dispositions among six IS 2020 competency realms.

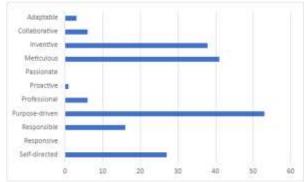

Figure 5: Distribution of key dispositions within the IS 2020 Systems Development competency realm.

Figure 6 shows the distribution of the 11 CC 2020 dispositions across all six competency realms in Figure 4. For IS as a whole, as envisioned by Leidig and Salmela et al. (2020), the most important key dispositions (in decreasing frequency of occurrence on pp. 95-182) are being purpose-driven, self-directed, meticulous, and inventive. The remaining seven dispositions occur between 51 times (professional) and one time (passionate).

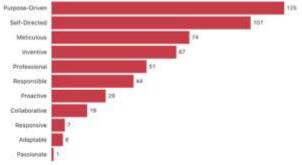

Figure 6: Aggregate distribution of key dispositions across all six IS 2020 competency realms.

5. THE CHALLENGE OF DISPOSITION IN COMPETENCY SPECIFICATION

[CC2020] offers a list of eleven prospective dispositions derived from the literature to round out the knowledge, skills, dispositions as components of competency. Disposition as an intrinsic component of competency represents the opportunity [for the competency author] to clearly express institutional and programmatic values expected in a graduate's work. Dispositional expectations enrich the description/assessment of competency and/or the related pedagogy. Ascribing a disposition to a competency indicates a clear commitment to selfreflection and a sober examination of mission, goals, and objectives to reach the clarity that enables its effective integration in curriculum design, the agency of pedagogy, and the character of professionalism. (CC2020 p. 134)

Indeed, the CC2020 competency model offers an enhanced and enlightened framework to detail technical expertise. It also expresses a purposeful intension of professionalism to serve society. The transliteration of the knowledge-centric aspects of past, traditional curricular descriptions is less fraught with challenge than the reflective process of discernment and specification of professional conduct and character in the medium of dispositions. It is the latter that we wish to explore in this paper.

Mindset Dimension – In cognitive psychology, a mindset represents the cognitive processes activated in response to a given task. (French & Chang, 2016) In decision theory and general systems theory, a mindset is a set of assumptions, methods, or notions held by one or more people or groups of people. (Cambridge English Dictionary)

In the adapted quotations that follow, the design theorist refers to *mindset* as "appreciative system" and *practitioner* as "stakeholder." (Waguespack, 2019, p. 27).

A [practitioner]'s [mindset] cues what facts to attend to in any particular experience while that same experience results in a learning effect that informs, reinforces and refines the [practitioner]'s apprehension of value and significance, thus altering that [mindset].

[A... mindset] is a complex and emergent agency of choice in [practitioner] behavior situated in a social context.

[Practitioners] possess [mindsets] individually as their experience and judgements are personal. In a community of [practitioners] there are recurrent threads of experience, shared knowledge, and commonly held norms that proceed from culture: social, professional, religious, or intellectual. A culture commonly promulgates a standard of appreciation that facilitates a shared cooperation and collaborative decision-making that reinforces community intentionally or unintentionally. Formal education, professional training, and certification, as well as religious communities, all purposefully foster aspects of shared culture to shape community identity, goals, and expectations of behavior. Shared culture is a basic defining aspect of any community - formal or informal. Any human conception of satisfaction is founded upon [a mindset] that is subject in part to the subjective interpretation of norms and aspirations individual and cultural metaphors.

Figures 7, 8, and 9 use mindmaps to extend the juxtaposition of the mindset dimension of the disposition with both the competency and the competency's task environment and context.

Figure 7: Mindset dimension of professionalism

Figure 8: Competency dimension

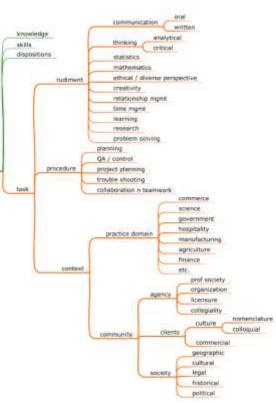

Figure 9: Competency: task aspect

6. THE REWARD OF DISPOSITION IN COMPETENCY SPECIFICATION

We argue that disposition specification provides a perspective of "meaning" that enables and activates the greatest promise of the consistency of a competency's availability and activation. As such, we claim that the greatest opportunity in the competency model is the degree to which dispositions, forged in practice, produce desirable behavior and outcomes. The connection between behavior and outcomes is framed by tasks and performance outcome expectations. The proof of a competency lies within the expected outcomes, artifacts, and action inherent in the competency. Time afforded to developing dispositions may well result in greater connection to the expected outcomes that the task environment desires.

To bolster this assertion, we take the position that Information Systems is inherently a design discipline where the appreciative system of the satisfaction of the "clients" requires an exquisite balance between feasibility and efficiency that demands dispositional maturity and acuity. As a designer, the IS professional, shaped by the performance expectations and responsibilities of competency, seeks a symmetric balance of quality and technical choice properties in a designed artifact. Dispositions, even the nascent list offered in the CC2020 report, provide the IS professional with an opportunity to balance motive and opportunity; to bridge the natural and artificial realms, and to explore and cultivate notions of satisfaction. This balance, perhaps the art of satisficing, becomes necessary when available models of satisfaction are emergent and incomplete, thus full client satisfaction is fleeting.

To satisfice is to recognize tradeoffs and engage in the design of generative metaphor. This reflects an ability to "critically think" and develop design actions in the face of uncertainty where clear paths to a satisfactory design outcome is not McGilcrist (2019) and Lakoff (1993) clear. suggest that to design amidst uncertainty is to engage in pattern recognition that is only possible via reference metaphors - to extrapolate from the to categorize the emergent. An known architecture or design concept will anchor the possible moves from one frame of reference for future possible design choices. Fred Brooks (1995) suggests that metaphor maps similar and dissimilar contexts and separates essence and accident. Extensions from metaphor is the process of situating emeraent constant phenomenon into categorical "buckets" of the known.

These are the skills that bring robustness (does it endure in its construction and withstand change?) and vitality (does it continue to thrive?) to the IS professional's designs and the necessary grounding for these competencies lies within dispositions.

To do so is to embrace, as a regular practice, the esoteric. The discipline and habit to do so is a dispositive (disposition-related) challenge for the design of a competency-based curriculum. Dispositions hold the key to long-term development and mastery, in praxis, of the metaphor, technical rationality, appreciative systems, and mastery medium of construction required for robustness and vitality as a professional.

7. DISPOSITIONS ARE VITAL FOR BECOMING

An important goal here is that the reader considers the inclusion of dispositions as an element of the competency model that is critical to effective competency authoring. The greatest potential for the inclusion and use of dispositions would be in their ability to sustain and carry the knowledge and skills dimension of the competency model forward. In this paper, we have examined this premise by extrapolating the work of Scanlon (2011) about *becoming* as it relates to *professionalizing*.

Conceptually, *professionalizing* is a process that is fueled from a synthesis of the components of a competency – knowledge, skills, and disposition – over time and through experience. As such, Scanlon's (2011) work on professionalizing may provide further insight as it provides an archetypal model of a professional as having a body of knowledge based on abstract concepts and theories. However, the application of these concepts and theories requires the exercise of considerable discretion, an occupationallycontrolled division of labor, credentialing procedures, training programs, and an ethic that encourages doing good rather than achieving economic gain.

Scanlon (2011) advocates that a professional's high social esteem is based on the provision of expert services from a position of power, trust, and discretion. Furthermore, it is proposed that professionals have fiduciary responsibilities to advance client well-being and to take responsibility for the governance and regulation of activities of their profession. Finally, Scanlon (2011) suggests that engagement in lifelong learning to better serve client needs is an essential aspect of maintaining fidelity and trust. While professionalism of this sort is not yet fully realized in computing disciplines, dispositions are fundamental to professionalizing. Thus, the maturity arc of "becoming" for computing must embrace the dispositive dimension that goes beyond technical rationality (Schön, 1983, 1987). The "becoming" that Scanlon (2011) describes appears to comport well with the possibilities and opportunities available when explicit focus is afforded to dispositions in a competency specification and а competency-based curriculum.

8. CONCLUDING REMARKS

This paper has attempted to clarify that the dispositive dimension is the matter most important to successful use of a competency based curricular approach in IS curriculum design. One argument for this being the case is that dispositions are the newest and most untested element of the competency model. As such, the means for designing curricula for this, as well as measurement approaches to monitor continuous improvement, may be less developed. Given the esoteric nature of the dispositive dimension, we have articulated our concern that the true promise of dispositions may be underaddressed in the development of competency-based computing curricula.

We have not taken a prescriptive approach here where best practices are articulated and tested strategies are sold. Rather, what we have attempted here is to advocate for extra care, further study, and cautious focus on the novelty of dispositions given the history of computing curricula reports and models. It is possible that embracing further study and comprehension of dispositions can lead to much-needed institutionalization of professionalism and development (Berger and Luckmann, 1967; Schutz, 1962) of the Information Systems discipline itself.

As such, we suggest that the ability to successfully develop a competency-based approach to Information Systems curricula depends more on dispositions (orientations, behaviors, and instincts in our students) than on technologies and tools that facilitate our designs and solutions. It is likely that the positive development of dispositions will outlast the ongoing changes in technologies. This is the promise we see in the assimilation of dispositions to nurture the "becoming" of our students.

Disposition	Elaboration
D-1 Proactive	With Initiative / Self-Starter Shows independence. Ability to assess and start activities independently without needing to be told what to do. Willing to take the lead, not waiting for others to start activities or wait for instructions.
D-2 Self-Directed	Self-motivated / Self-Directed Demonstrates determination to sustain efforts to continue tasks. Direction from others is not required to continue a task toward its desired ends.
D-3 Passionate	With Passion / Conviction Strongly committed to and enthusiastic about the realization of the task or goal. Makes the compelling case for the success and benefits of task, project, team or means of achieving goals.
D-4 Purpose-Driven	Purposefully engaged / Purposefulness Goal-directed, intentionally acting and committed to achieve organizational and project goals. Reflects an attitude towards the organizational goals served by decisions, work or work products. e.g., Business acumen.
D-5 Professional	With Professionalism / Work ethic. Reflecting qualities connected with trained and skilled people: Acting honestly, with integrity, commitment, determination and dedication to what is required to achieve a task.
D-6 Responsible	With Judgement / Discretion / Responsible / Rectitude Reflect on conditions and concerns, then acting according to what is appropriate to the situation. Making responsible assessments and taking actions using professional knowledge, experience, understanding and common sense. E.g., Responsibility, Professional astuteness.
D-7 Adaptable	Adaptable / Flexible / Agile Ability or willingness to adjust approach in response to changing conditions or needs.
D-8 Collaborative	Collaborative / Team Player / Influencing Willingness to work with others; engaging appropriate involvement of other persons and organizations helpful to the task. Striving to be respectful and productive in achieving a common goal.
D-9 Responsive	Responsive / Respectful Reacting quickly and positively. Respecting the timing needs for communication and actions needed to achieve the goals of the work.
D-10 Meticulous	Attentive to Detail Achieves thoroughness and accuracy when accomplishing a task through concern for relevant details.
D-11 Inventive	Exploratory / Inventive Looking beyond simple solutions; Examining alternative ideas and solutions; seeks, produces and integrates appropriate alternative
